Moveit Trajectory Planning

Moveit Trajectory Planning
- 1. Usage Environment
- 2. Driving the Real Machine
  - 2.1 Starting the Real Device
  - 2.2 Starting MoveIt2
- 3. Trajectory Planning
  - 3.1. Visualization
  - 3.2. Launch Command
  - 3.3. Source Code Analysis

1. Usage Environment

ROS2: Humble

Enter the commands in the tutorial into the accompanying virtual machine to run the function.

2. Driving the Real Machine

Driving the real machine is achieved by subscribing to the Moveit2 `/joint_states` topic, converting the joint state information of the robotic arm into control data for the actual robotic arm.

Note: Since the real robotic arm does not have obstacle avoidance capabilities, some poses may encounter obstacles; therefore, the planned robotic arm movements should be as reasonable as possible and avoid locations with obstacles.

(It is recommended to use preset poses for demonstrating the driving of the real machine.)

The motherboard and virtual machine need to be configured for multi-machine communication. The robotic arm and virtual machine need to be on the same network, and the virtual machine's `ros_domain_id` must be consistent with the `ros_domain_id` in the Docker container. (Both devices are pre-configured with the same ros_domain_id at the factory; simply ensure the virtual machine and the robotic arm are on the same network.)

2.1 Starting the Real Device

```
#Start this command in Docker:
ros2 run dofbot_ctrl SimulateToArm
```

2.2 Starting MoveIt2

```
#Jetson-nano motherboard users need to start this command in the virtual machine;
Orin motherboard users can run this command directly on the motherboard.

ros2 launch dofbot_moveit demo.launch.py
```

3. Trajectory Planning

After the program runs, the robotic arm will plan the trajectory to the target position, and the robotic arm's end effector will draw the motion trajectory in RViz2.

3.1. Visualization

Before executing the launch command, you must add the `MarkerArray` plugin in `RViz2` to display the planned path. For the `MarkerArray`, you need to select the `arm_group` topic.

3.2. Launch Command

Ensure that the robotic arm has successfully loaded in MoveIt and that the message `You can start planning now!` appears. Then, run the following command: the robotic arm will automatically trace the trajectory of the planned path.

```
# Execute this command within the virtual machine
ros2 run dofbot_moveit multi_track_motion
```

3.3. Source Code Analysis

Source Code Path:

```
# Path within the virtual machine
~/dofbot_ws/src/dofbot_moveit/src/multi_track_motion.cpp
```

```
#include <rclcpp/rclcpp.hpp>
#include <moveit/move_group_interface/move_group_interface.h>
#include <moveit/planning_scene_interface/planning_scene_interface.h>
#include <geometry_msgs/msg/pose.hpp>
#include <random>
#include <moveit_visual_tools/moveit_visual_tools.h>
#include <moveit_msgs/msg/display_trajectory.hpp>
#include <vector>
#include <moveit/robot_trajectory/robot_trajectory.h>
#include <moveit/robot_state/robot_state.h>
#include <moveit/robot_model/robot_model.h>
#include <moveit/robot_model_loader/robot_model_loader.h>
