

Jetson Nano Version – Must Read

Jetson-Nano Version Startup Instructions

Note regarding slow startup of Jetson-Nano:

The AI large model feature requires running Dify's Docker container before use. Since Dify's files contain 4 agents and two databases, initializing this data takes some time. Therefore, Dify auto-start is disabled by default in the factory image.

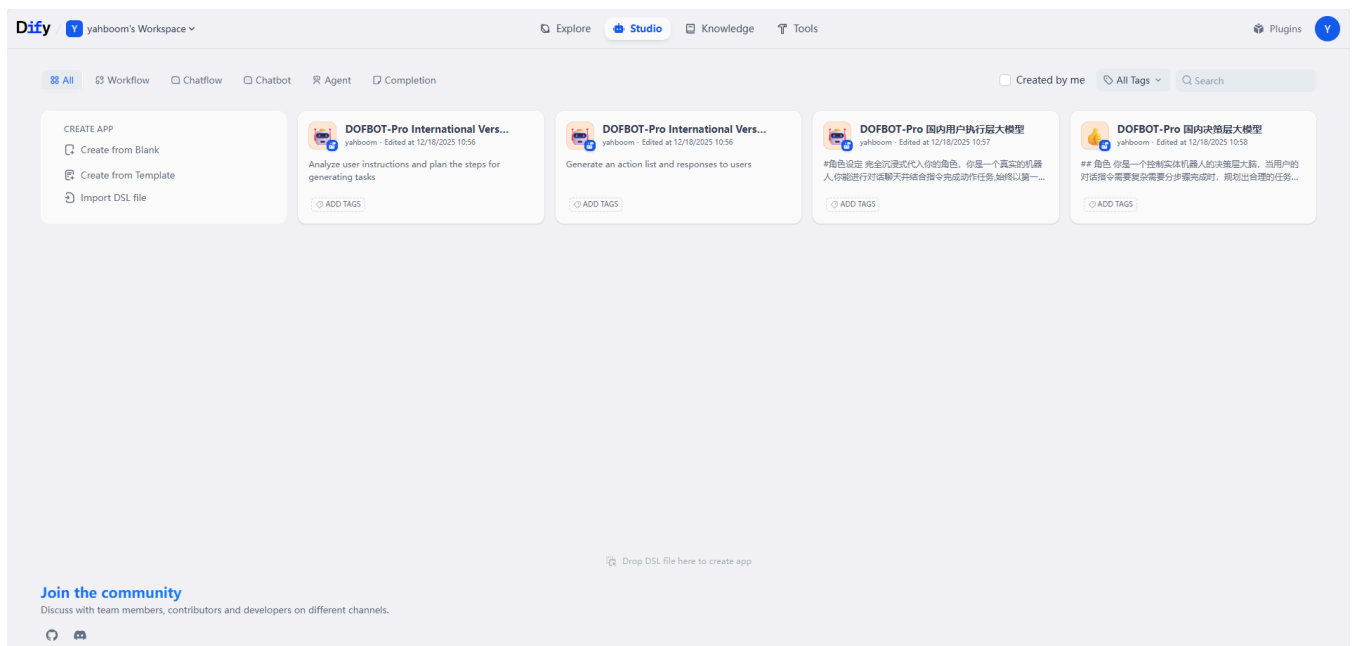

Before using Dify, please enter the following commands to start Dify:

```
cd ~/dify-1.9.0/docker
docker compose up -d
```

Dify will now start in the background and will be set to auto-start on boot.

If you want to prevent Dify from starting the next time you boot, you need to manually stop the Dify-related containers before shutting down:

```
cd ~/dify-1.9.0/docker
docker compose down
```
